Functional analysis is a branch of mathematical analysis, the core of which is formed by the study of vector spaces endowed with some kind of limit-related structure (e.g. inner product, norm, topology, etc.) and the linear functions defined on these spaces and respecting these structures in a suitable sense. The historical roots of functional analysis lie in the study of spaces of functions and the formulation of properties of transformations of functions such as the Fourier transform as

Here is Problem 9 in the Problem Set following Section 2.7 in the book *Introductory Functional Analysis With Applications* by Erwin Kryszeq: Let $C[0,1]$ denote the set of all (real- or complex-valued) functions defined and continuous on the closed interval $[0,1]$ with the norm defined as follows: $\|x\|_{C[0,1]} = \max_{t \in [0,1]} |x(t)|$, $\forall x \in C[0,1]$. Let $T: C[0,1] \rightarrow C[0,1]$ be defined by $(Tx)(t) = \int_0^t x(\tau) d\tau$, $\forall x \in C[0,1]$.
