Domestic and wild animals for their frank association and dependence on natural resources are usually prone to be infected with one or other or multiple parasitic infections, helminth parasites being most common and consistently present. Helminth parasites are such organisms that cause enormous hidden losses to animal health and production industry, that if checked properly can bring huge profits. Their unnoticeable nature of mild infections in general, renders them escape the attention of concerned persons in the profession. They feed and perpetuate on the nutrition and body constituents of t

Diagnostic Stage:- A developmental stage of a pathogenic organism that can be detected in stool, blood, urine, sputum, CSF or other human body secretions.

Infective Stage:- The stage of parasite at which it is capable of entering the host and continue development within the host.

Infection:- Invasion of the body by any pathogenic organism (except)arthropods and the reaction of the hosts tissue to the presence of the parasite or related toxins.Â

2. Herbivores animals commonly constitute the source for human infection with Trychostrongylus species.

F. Human beings:-Another person his clothing, bedding or the immediate environment that he contaminated are directly responsible for all or a considerable amount of infection with a pathogenic amoeba E. histolytica, E. vermicularis
