Click on the link Climate models predict we're currently on track for a heating of somewhere between 3C and 4C for 2100, although bear in mind that these are global average temperatures " at the poles and over land (where people live), the increase may be double that. Over the past decade, scientists have been able to produce a far more nuanced picture of how temperature rise affects the complexities of cloud cover and atmospheric and oceanic circulation patterns and ecology. From 2030, more than half the population will live in the tropics, an area that makes up a third of the planet and already struggles with climate impacts. Poultry may be viable on the edges of farmland and synthetic meats and other foods will meet some of the demand.
