

PROCEEDINGS OF SPIE

Low-Dimensional Materials and Devices 2019

Nobuhiko P. Kobayashi
A. Alec Talin
Albert V. Davydov
Editors

11–13 August 2019
San Diego, California, United States

Sponsored and Published by
SPIE

Volume 11085

Proceedings of SPIE 0277-786X, V. 11085

SPIE is an international society advancing an interdisciplinary approach to the science and application of light.

The papers in this volume were part of the technical conference cited on the cover and title page. Papers were selected and subject to review by the editors and conference program committee. Some conference presentations may not be available for publication. Additional papers and presentation recordings may be available online in the SPIE Digital Library at SPIEDigitalLibrary.org.

The papers reflect the work and thoughts of the authors and are published herein as submitted. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

Please use the following format to cite material from these proceedings:

Author(s), "Title of Paper," in *Low-Dimensional Materials and Devices 2019*, edited by Nobuhiko P. Kobayashi, A. Alec Talin, Albert V. Davydov, Proceedings of SPIE Vol. 11085 (SPIE, Bellingham, WA, 2019) Seven-digit Article CID Number.

Publication of record for individual papers is online in the SPIE Digital Library.

SPIE. DIGITAL LIBRARY

SPIEDigitalLibrary.org

Paper Numbering: *Proceedings of SPIE* follow an e-First publication model. A unique citation identifier (CID) number is assigned to each article at the time of publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online and print versions of the publication. SPIE uses a seven-digit CID article numbering system structured as follows:

- The first five digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc. The CID Number appears on each page of the manuscript.

Contents

v *Authors*
vii *Conference Committee*

0D STRUCTURES AND CLUSTERS I

11085 07 **Engineering site-controlled quantum dots for optical quantum information processing (Invited Paper)** [11085-6]

0D STRUCTURES AND CLUSTERS II

11085 0F **Red emission carbon dots for microLED application** [11085-14]

11085 0H **Preparation of highly stability Zn_xCd_{1-x}S white light quantum dots by silica coating** [11085-16]

LOW-D DEVICES

11085 0L **Opportunities for transition metal oxide devices in solid state random number generators (Invited Paper)** [11085-20]

2D AND LAYERED STRUCTURES I

11085 0Q **Effect of annealing on electrochemical stability of chemically preintercalated bilayered vanadium oxide cathodes in batteries** [11085-25]

2D AND LAYERED STRUCTURES II

11085 0R **Two-dimensional hybrid organic-inorganic semiconductors deposited by resonant infrared, matrix-assisted pulsed laser evaporation (Invited Paper)** [11085-26]

11085 0T **Near-infrared photonic phase-change properties of transition metal ditellurides (Invited Paper)** [11085-28]

11085 0U **The effect of growth temperature and metal-to-chalcogen on the growth of WSe₂ by molecular beam epitaxy (Invited Paper)** [11085-29]

2D AND LAYERED STRUCTURES III

- 11085 0W **Electric field induced variations of excited state lifetimes and photoluminescence spectra in 2D heterostructures** [11085-31]
- 11085 0Y **Revealing of intrinsic intralayer phonon coupling by polarization-resolved analysis in monolayer MoS₂** [11085-33]

POSTER SESSION

- 11085 12 **Microstructural characterization and phase transitions in polycrystalline and nanocrystalline doped zirconia for incorporation in medical prosthesis** [11085-36]
- 11085 13 **Study of magnetic properties of a nano-graphene monolayer within Ising ferromagnetic model with mixed spins** [11085-37]
- 11085 15 **Polarization-dependent optical absorption in phosphorene flakes** [11085-39]
- 11085 16 **Improved carrier confinement and strain profile in heterogeneously coupled SK-SML quantum dot heterostructure** [11085-40]
- 11085 17 **Investigation of various capping layer configuration on heterogeneously coupled SML on SK quantum dots heterostructure** [11085-41]
- 11085 18 **The effects of V-III ratio on structural and optical properties of self-assembled InAs quantum dots** [11085-42]
- 11085 19 **The effect of growth rate variation on structural and optical properties of self assembled InAs quantum dots** [11085-43]
- 11085 1A **A detailed investigation on the impact of variation in monolayer coverage on optical properties of InAs/GaAs multilayer quantum dot heterostructure** [11085-44]
- 11085 1D **Effect of substrate temperature variation on the structural and optical properties of self assembled InAs quantum dots** [11085-47]
- 11085 1F **Realizing Li-ion full cell using LiFePO₄ cathode and Mn₃O₄-mesoporous carbon composite anode for energy storage applications** [11085-49]
- 11085 1J **HCDI performance of Na-2x3 and Na-2x4 nanowires for water desalination** [11085-53]
- 11085 1K **Influence of quaternary (In_{0.21}Al_{0.21}Ga_{0.58}As) capping on the performance of InAs quantum dot infrared photodetector** [11085-54]
- 11085 1N **Optical and structural investigation of ex-situ passivated strain coupled InAs surface quantum dots** [11085-57]
- 11085 1O **The enhancement in luminescence property of chemically passivated near surface quantum well and quantum dots** [11085-58]

A two-dimensional semiconductor (also known as 2D semiconductor) is a type of natural semiconductor with thicknesses on the atomic scale. The rising research attention towards 2D semiconductors started with a discovery by Geim and Novoselov et al. in 2004,[1] when they reported a new semiconducting material graphene, a flat monolayer of carbon atoms arranged in a 2D honeycomb lattice. Some devices applications include electronic devices, photonic and energy harvesting devices, and flexible and transparent substrates. Electronic Devices[edit]. The atomically thin structure allows for lower surface recombination velocity, which leads to better photocurrent conduction. Low dimensional materials refer to those systems in which electronic state wavefunction is confined, at least in one of the three dimensions. Electronic confinement generally appears in the range from 1 nm to 100 nm. In these materials, spatial constraints give rise to quantum size effects, which can significantly alter their electronic properties and deeply modify their behavior, as compared to their bulk counterparts. The primary goals of Lowdim are the synthesis of novel 2D materials and the fundamental understanding of their properties. Current work-areas of the Unit include: The development of preparation techniques which may produce large-area crystalline 2D layered materials exhibiting tunable band gaps. Above all, the multi-dimensional vibration mitigation devices and materials are found to be effective for reducing multi-dimensional vibrations. However, enhancing the mitigation performance of the devices in each direction, including improving the mitigation capability of materials, is still a challenging issue. Key Laboratory of C&PC Structures of the Ministry of Education, Southeast University, Nanjing, China.
