Human embryogenesis. Google Classroom. Facebook. Twitter. Email. Embryogenesis, the first eight weeks of development after fertilization, is an incredibly complicated process. It's amazing that in eight weeks we're transforming from a single cell to an organism with a multi-level body plan. The circulatory, excretory, and neurologic systems all begin to develop during this stage. Like all deuterostomes, humans have bilateral symmetry, which means that there is a single axis across which we can split ourselves to make mirror images. What we are actually seeing when we look at a primitive streak are moving cells. They are going from the epiblast and moving down so they end up between the original epiblast layer and the hypoblast.
