Schouten had 21 written records

Brian Crimmins wrote to Schouten in 1969 and the pair came to Chichester to do a study on the written records cases
mentioned earlier. The main criticism of this cases is that the families might selectively remember what the child really did say and forget the inconsistent statements or details they cannot recall.

studies. Schouten had 21 written records

Thomas Moore has been studying a related hypothesis that parents promote
the cases. Perhaps unconsciously through expectations, reinforcements,
and then selectively perceive it in the environment.

Michael Murphy asked for more descriptive detail about the most striking cases. Emily felt that the case in Thailand with the birthmark on the back of the child was the most interesting.

The second variable involves the actual interaction between the parents and the child; how much and what kind of interaction do parents have with their children. These interactions can be positive or negative, and they can influence the child's experience of the birthmark. If parents are aware of the birthmark and talk about it with the child, it may suggest that the birthmark is significant to them. On the other hand, if parents ignore the birthmark or do not talk about it, it may suggest that they do not consider it important.
