However, different specifications and test methods apply to adhesives and sealants, and most often they are designed to perform different functions. Their denitions hint at these differing functions. Both adhesives and sealants function primarily by the property of adhesion. Adhesion is the attraction of two different substances resulting from intermolecular forces between the substances. This is distinctly different from cohesion, which involves only the intermolecular attractive forces within a single substance.

For those new to the field, the Handbook will provide a fundamental knowl The Handbook of Adhesion Technology is intended to be the definitive reference in the field of adhesion. Essential information is provided for all those concerned with the adhesion phenomenon. Adhesion is a phenomenon of interest in diverse scientific disciplines and of importance in a wide range of technologies. It is arranged in a user-friendly format with ten main sections: theory of adhesion, surface treatments, adhesive and sealant materials, testing of adhesive properties, joint design, durability, manufacture, quality control, applications and emerging areas. Each section contains about five chapters written by internationally renowned authors who are authorities in their fields. This book, containing bountiful information, should serve for veterans as a commen-tary on the current state of knowledge regarding adhesives, and as a Baedeker for those who wish to make their maiden voyage into the wonderful and technologically important area of adhesives. The history of adhesives and sealants is closely related to the history of humankind. Some of what are thought of as relatively "new" uses of adhesives have their origins in ancient times, and although most of these materials have been subject to vast changes, others have been changed very little over time. As new materials are developed, a review of the history of uses can lead one to see where they might be applied to improve old applications, and sometimes to satisfy requirements of entirely new applications.
