I've also read the Analysis text by Lieb and Loss and I also took a graduate level class on complex analysis, which went up to Big Picard and some Nevanlinna theory. For my own amusement I've thought about furthering my knowledge of general analysis. I've heard wonderful things about Stein's book on Singular integrals and his Fourier analysis on Euclidean spaces. Would these be an interesting next step? I'm especially interested in learning more about harmonic analysis and especially learning enough to understand the modern language of these fields. EDIT: Here's m Some of these text books are recommended while some are not. The only thing you have to focus is whichever book you choose to study , keep the same book till your prof. The best way to study and pass with good marks is first choose one book as your main book and keep other books as reference books. Then add points from reference books to main book. This principle applies to all subjects till final year MBBS. Before we share the books, lets get familiar with books to study in first year MBBS. You need to know that how many books in total you have to study to clear your first professional MBBS.
