

# Aeroacoustics of Flight Vehicles, Theory and Practice

## Volume 1: Noise Sources; Volume 2: Noise Control

Harvey H. Hubbard, Editor

Published in 1994; Originally Published in 1991

### Volume 1--Table of Contents

Technical Reviewers

Symbols

#### **1. Propeller and Propfan Noise - B. Magliozzi, D.B. Hanson, and R.K. Amiet**

Introduction

Description of Propellers

Propeller Noise Characteristics

Propeller Noise-Generating Mechanisms

Prediction Methods for Propeller Harmonic Noise

Prediction Methods for Propeller Broadband Noise

Propagation Effects

Comparisons of Predictions and Measurements

Propeller Noise Control Objectives

Control of Propeller Noise

Synchrophasing

References

#### **2. Rotor Noise - F.H. Schmitz**

Introduction

Rotorcraft Noise sources and Their Physical Origins

Some Measured Data

Scaling Rotor Noise

Theoretical Developments and Experimental Verification

Rotorcraft Acoustic Design Trends

References

#### **3. Turbomachinery Noise - John F. Groeneweg, Thomas G. Sofrin, Edward J. Rice, and Phillip R. Gliebe**

Introduction

Process Description: Theory

Mechanism Identification: Experiment

Application of Theory and Experiment to In-Flight  
Sources

Full-Scale Engine Applications

Concluding Remarks

References

#### **4. Jet Noise Classical Theory and Experiments - G.M. Lilley**

Introduction

Lighthill's Theory of Aerodynamic Noise

The Effects of Convection

The Spectrum of Aerodynamic Noise

The Structure of a Turbulent Jet

The Acoustic Analogy Source Model in Jet Noise

Jet Noise at Subsonic Speeds

Experimental Considerations

Jet Noise Reduction Techniques

Alternative Theories of Aerodynamic Noise

Conclusions

References

#### **5. Noise From Turbulent Shear Flows - M.E. Goldstein**

Introduction

Solid-Surface Effects

Sound Generated by Turbulence Interacting With  
Itself: The Jet Noise Problem

Extensions to More Complex Turbulent Flows

Supersonic Flows

References

#### **6. Jet Noise Generated by Large-Scale Coherent Motion - Christopher K.W. Tam**

Introduction

Large Turbulence Structures and Instability Waves

Characteristics of Supersonic Jet Noise

Turbulent Mixing Noise Generated by Large Turbulence

Structures and Instability Waves of Supersonic Jets

Theories of Broadband Shock-Associated Noise

Generation and Prediction of Screech Tones

Noncircular Supersonic Jets

Acoustically Excited Jets

Additional Topics

References

#### **7. Airframe Noise - David G. Crighton**

Introduction

Overview of Experimental Results

Whole Aircraft Correlations

Trailing-Edge Noise

Flap Side-Edge Noise

Undercarriage Gear Noise

Cavity Noise

Turbulent Boundary Layer and Panel Vibration Noise

Noise of Powered-Lift Configurations

Development of a Comprehensive Prediction Scheme

Conclusions

References

#### **8. Propulsive Lift Noise - Martin R. Fink**

Introduction

Description of Propulsive Lift Vehicles

Experimental Observations of Propulsive Lift Noise

Noise Mechanisms and Underlying Physical Concepts

Prediction Methods

Comparisons

Full-Scale Implementations

References

#### **9. Combustion and Core Noise - J. Robert Mahan and Allen Karchmer**

Introduction

Configuration Variables

Operational Variables  
Characteristics of Combustion and Core Noise  
Sources of Combustion Noise  
Introduction to Combustion Noise Theory  
Combustion Noise Theory and Comparison With  
Experiment  
Available Prediction Methods  
Diagnostic Techniques  
Reciprocating-Engine Combustion Noise  
References

## **10. Sonic Boom - Domenic J. Maglieri and Kenneth J. Plotkin**

Introduction  
Nature of Sonic Booms  
Role of the Atmosphere  
Review and Status of Theory  
Measurements and Predictions  
Sonic Boom Minimization  
Responses to Sonic Booms  
Summary  
References

Glossary of Terms  
Index

## **Volume 2--Table of Contents**

Technical Reviewers

### **11. Human Response to Aircraft Noise - Clemans A. Powell and James M. Fields**

Introduction  
Perception of Sound  
Noise Metrics for Predicting Human Response  
Laboratory Assessment of Human Response  
Field Assessment of Human Response  
Noise Regulations, Criteria, and Recommended  
Practices  
References

### **12. Atmospheric Propagation - Tony F.W. Embleton and Gilles A. Daigle**

Introduction  
Geometrical Spreading  
Effects Due to the Presence of the Ground  
Refraction by Vertical Gradients of Wind and  
Temperature  
Atmospheric Turbulence  
Discussion  
Diffraction  
Large-Amplitude Waves, Pulses, and Sonic Booms  
Standards  
References

### **13. Theoretical Models for Duct Acoustic Propagation and Radiation - Walter Eversman**

Introduction  
The Acoustic Field Equations  
Propagation in Uniform Ducts With Hard Walls  
Attenuation Calculations in Lined Uniform Ducts  
Solution of the Eigenvalue Problem  
Nonuniform Ducts  
References

### **14. Design and Performance of Duct Acoustic Treatment - R.E. Mottsinger and R.E. Kraft**

Orientation  
Design Approach  
Fundamentals of Duct Liner Technology  
Empirical and Semiempirical Design Methods  
Recommendations for Further Research  
References

### **15. Jet Noise Suppression - P.R. Gliebe, J.F. Brausch, R.K. Majjigi, and R. Lee**

Introduction  
Theoretical Concepts of Jet Noise Generation and  
Suppression  
Jet Noise Suppression Concepts  
Summary  
References

### **16. Interior Noise - John S. Mixson and John F. Wilby**

Introduction  
Sources of Interior Noise  
Airborne Noise  
Structure-Borne Noise  
Source-Path Identification  
Noise Control Application  
References

### **17. Flyover-Noise Measurement and Prediction - Noel A. Peart, M.J.T. Smith, B. Magliozzi, Harry Sternfeld, and the Boeing Noise Engineering Organization**

Introduction  
Measurement of Noise Produced by Airplanes  
Powered by Turbofan Engines  
Measurement of Helicopter Noise  
Factors Influencing Sound Propagation (Full-Scale  
Static and Flight Testing)  
Prediction of Noise for Airplanes Powered by  
Turbofan Engines

Prediction of Noise for Airplanes Powered by  
Propellers or Propfans  
References

Major Operational Considerations  
The Design and Development Process  
Noise Engineering of Other Flight Vehicles

## **Preface to Volumes 1 and 2**

The field of aeroacoustics has matured dramatically in the past two decades. Researchers have gained significant theoretical and experimental understanding of the noise generated by aircraft power plants and their components. In addition, airframe noise and interior noise have been investigated extensively. The physical understanding obtained from these efforts has resulted in the development of hardware capable of reducing community noise and of meeting strict noise certification requirements. Reductions in overall sound pressure level of 20 to 30 dB have been obtained for some types of power plants, while in the same period their installed power has increased significantly.

Current quiet flight vehicle designs are based on information reported in a multitude of journals, conference proceedings, research reports, and specialized books. Each of these scientific publications represents only incremental steps in the evolution of our present understanding of the various aeroacoustic noise generation and propagation mechanisms and procedures for noise control. There is thus a need for a reference document summarizing the current status of aeroacoustics. It is recognized that some other fine books on aeroacoustics are already available. The reader is referred to the classic handbooks by Harris on noise and vibration control; to Goldstein's "Aeroacoustics," which provides a general theoretical treatment of most aeroacoustic noise sources; to the text "Noise and Acoustic Fatigue in Aeronautics" by Richard and Mead; and to the AIAA Preprint Series volume entitled "Aerodynamic Noise." The current book represents an attempt to integrate and update the information in previous related publications, to provide a balanced viewpoint with both fundamental and applied aspects being considered, and to focus on those topics that are significant for the design and operation of quiet flight vehicles.

In July 1982, the Continuing Education Subcommittee of the Institute of Aeronautics and Astronautics (AIAA) Aeroacoustics Technical Committee identified a critical need for a reference book summarizing and interpreting the status of research in aeroacoustics. The full Aeroacoustics Technical Committee agreed with this conclusion and enthusiastically supported the concept of publishing such a book. The book would have a scope consistent with that of the Technical Committee and would include physics of noise produced by motion of fluids and bodies through the atmosphere and by chemical reaction processes; it would also include the responses of human beings, structures, and the atmosphere to aerodynamic noise. The subcommittee was then instructed to prepare an initial outline of the book for planning purposes and to procure financial support for its printing. This effort has been given generous support by the Langley, Lewis and Ames Research Centers of the National Aeronautics and Space Administration (NASA); the U.S. Air Force Wright Research and Development Center; and the U.S. Army Aviation Systems Command.

This book is planned as a reference publication, easily readable by persons with scientific or engineering training who have completed a bachelor degree study program. It serves as an authoritative resource book for teachers, students, and researchers, but it is not designed for use directly as a textbook. It provides recommended methodology to evaluate aeroacoustics-related problems and suggests approaches to their solutions, without extensive tables, nomographs, and derivations. It is oriented

toward flight vehicles and emphasizes underlying physical concepts. Theoretical, experimental, and applied aspects are covered, including the main formulations, and comparisons of theory and experiment.

The preparation of the material for this book has been carried out under the general supervision of the AIAA Technical Committee on Aeoracoustics. The Committee elected the editor (Harvey H. Hubbard), two associate editors (Christopher K.W. Tam and Robert H. Schlinker), and six additional editors (Charles E. Feiler, James C. Yu, Walter K. Eversman, Marvin E. Goldstein, Robert E. Kraft, and Yung H. Yu). Donald L. Lansing and John Laufer (until his untimely death) also served for short terms. They functioned as an editorial board to establish the overall policy for the organizing reviewing, and editing of the book. Each was selected because of his expert knowledge of at least one of the specialty areas covered in the book. They collectively comprise a team of experts who represent industry, government, and academia viewpoints.

The editorial board members chose by vote the lead authors for each chapter based on their stature and expertise in particular technical areas and on their proven ability to communicate. In all cases, contributing authors were selected and enlisted by the lead authors and on the basis of the same criteria. An outline of each chapter was first approved by the editorial board as a means of defining the overall scope of that chapter. Technical reviewers were chosen by vote of the editorial board based on their expertise of subject matter and the nature of their experience. Two to four persons were selected to provide technical reviews for each manuscript. These technical reviews were then provided to the appropriate authors as a basis for the preparation of their final manuscripts. Final editing was accomplished by Mary K. McCaskill and Thomas H. Brinkley of the NASA Langley Research Center Technical Editing Branch. This latter effort involved skilled technical editors closely associated with the publication profession. Their work included checking for accuracy, grammar, consistency of style, compliance with editorial instructions, and assembly for printing.

Authors and reviewers contributed their time for this project without receiving compensation. Draft manuscript preparation, typing, and graphics were supported partially or wholly by the participant's employer. All these contributions were vital to the success of this project and are greatly appreciated. Supporting reference information cited in this book is limited to publications available at the time of the text preparation. No proprietary or classified information is included in order to protect the interests of authors' companies and governments. In order to enhance its utility, this book is divided into two volumes, each of which has a list of symbols, an index, and a separate glossary of terms. Reference lists for each chapter contain the key available supporting documents.

Volume 1 includes all the chapters that relate directly to the sources of flight vehicle noise: Propeller and Propfan Noise; Rotor Noise; Turbomachinery Noise; Jet Noise Classical Theory and Experiments; Noise From Turbulent Shear Flows; Lift Noise; Combustion and Core Noise; and Sonic Boom. Volume 2 includes those chapters that relate to flight vehicle noise control and/or operations: Human Response to Aircraft Noise; Atmospheric Propagation; Theoretical Models for Duct Acoustic Propagation and Radiation; Design and Performance of Duct Acoustic Treatment; Jet Noise Suppression; Interior Noise; Flyover-Noise Measurement and Prediction; and Quiet Aircraft Design and Operational Characteristics. This book was published initially in August 1991 as NASA Reference Publication 1258, Vols. 1 and 2, and with a companion United States Air Force Wright Research and Development Center designation as Technical Report 90-3052, Vols. 1 and 2. It was printed in soft cover and carried the appropriate NASA, U.S. Air Force, and U.S. Army logos on its covers.

In November 1993, the Acoustical Society of America agreed to reprint it in a hard-cover version but with modifications to the covers and title pages and with minor changes and corrections to the text. Elaine Moran of the Acoustical Society of America and Andrew Prince of the American Institute of Physics have coordinated the preparation of materials for this reprinting.
