# Volume 1—Table of Contents

**Technical Reviewers**

**Symbols**

### 1. Propeller and Propfan Noise - B. Magliozzi, D.B. Hanson, and R.K. Amiet
- **Introduction**
- Description of Propellers
- Propeller Noise Characteristics
- Propeller Noise-Generating Mechanisms
- Prediction Methods for Propeller Harmonic Noise
- Prediction Methods for Propeller Broadband Noise
- Propagation Effects
- Comparisons of Predictions and Measurements
- Propeller Noise Control Objectives
- Control of Propeller Noise
- Synchrophasing
- References

### 2. Rotor Noise - F.H. Schmitz
- **Introduction**
- Rotorcraft Noise sources and Their Physical Origins
- Some Measured Data
- Scaling Rotor Noise
- Theoretical Developments and Experimental Verification
- Rotorcraft Acoustic Design Trends
- References

- **Introduction**
- Process Description: Theory
- Mechanism Identification: Experiment
- Application of Theory and Experiment to In-Flight Sources
- Full-Scale Engine Applications
- Concluding Remarks
- References

- **Introduction**
- Lighthill's Theory of Aerodynamic Noise
- The Effects of Convection
- The Spectrum of Aerodynamic Noise
- The Structure of a Turbulent Jet
- The Acoustic Analogy Source Model in Jet Noise
- Jet Noise at Subsonic Speeds
- Experimental Considerations
- Jet Noise Reduction Techniques
- Alternative Theories of Aerodynamic Noise
- Conclusions
- References

### 5. Noise From Turbulent Shear Flows - M.E. Goldstein
- **Introduction**
- Solid-Surface Effects
- Sound Generated by Turbulence Interacting With Itself: The Jet Noise Problem
- Extensions to More Complex Turbulent Flows
- Supersonic Flows
- References

### 6. Jet Noise Generated by Large-Scale Coherent Motion - Christopher K.W. Tam
- **Introduction**
- Large Turbulence Structures and Instability Waves
- Characteristics of Supersonic Jet Noise
- Turbulent Mixing Noise Generated by Large Turbulence Structures and Instability Waves of Supersonic Jets
- Theories of Broadband Shock-Associated Noise Generation and Prediction of Screech Tones
- Noncircular Supersonic Jets
- Acoustically Excited Jets
- Additional Topics
- References

### 7. Airframe Noise - David G. Crighton
- **Introduction**
- Overview of Experimental Results
- Whole Aircraft Correlations
- Trailing-Edge Noise
- Flap Side-Edge Noise
- Undercarriage Gear Noise
- Cavity Noise
- Turbulent Boundary Layer and Panel Vibration Noise
- Noise of Powered-Lift Configurations
- Development of a Comprehensive Prediction Scheme
- Conclusions
- References

### 8. Propulsive Lift Noise - Martin R. Fink
- **Introduction**
- Description of Propulsive Lift Vehicles
- Experimental Observations of Propulsive Lift Noise
- Noise Mechanisms and Underlying Physical Concepts
- Prediction Methods
- Comparisons
- Full-Scale Implementations
- References

### 9. Combustion and Core Noise - J. Robert Mahan and Allen Karchmer
- **Introduction**
- Configuration Variables
- References
Volume 2--Table of Contents

The field of aeroacoustics has matured dramatically in the past two decades. Researchers have gained significant theoretical and experimental understanding of the noise generated by aircraft power plants and their components. In addition, airframe noise and interior noise have been investigated extensively. The physical understanding obtained from these efforts has resulted in the development of hardware capable of reducing community noise and of meeting strict noise certification requirements. Reductions in overall sound pressure level of 20 to 30 dB have been obtained for some types of power plants, while in the same period their installed power has increased significantly.

Current quiet flight vehicle designs are based on information reported in a multitude of journals, conference proceedings, research reports, and specialized books. Each of these scientific publications represents only incremental steps in the evolution of our present understanding of the various aeroacoustic noise generation and propagation mechanisms and procedures for noise control. There is thus a need for a reference document summarizing the current status of aeroacoustics. It is recognized that some other fine books on aeroacoustics are already available. The reader is referred to the classic handbooks by Harris on noise and vibration control; to Goldstein's "Aeroacoustics," which provides a general theoretical treatment of most aeroacoustic noise sources; to the text "Noise and Acoustic Fatigue in Aeronautics" by Richard and Mead; and to the AIAA Preprint Series volume entitled "Aerodynamic Noise." The current book represents an attempt to integrate and update the information in previous related publications, to provide a balanced viewpoint with both fundamental and applied aspects being considered, and to focus on those topics that are significant for the design and operation of quiet flight vehicles.

In July 1982, the Continuing Education Subcommittee of the Institute of Aeronautics and Astronautics (AIAA) Aeracoustics Technical Committee identified a critical need for a reference book summarizing and interpreting the status of research in aeroacoustics. The full Aeracoustics Technical Committee agreed with this conclusion and enthusiastically supported the concept of publishing such a book. The book would have a scope consistent with that of the Technical Committee and would include physics of noise produced by motion of fluids and bodies through the atmosphere and by chemical reaction processes; it would also include the responses of human beings, structures, and the atmosphere to aerodynamic noise. The subcommittee was then instructed to prepare an initial outline of the book for planning purposes and to procure financial support for its printing. This effort has been given generous support by the Langley, Lewis and Ames Research Centers of the National Aeronautics and Space Administration (NASA); the U.S. Air Force Wright Research and Development Center; and the U.S. Army Aviation Systems Command.

This book is planned as a reference publication, easily readable by persons with scientific or engineering training who have completed a bachelor degree study program. It serves as an authoritative resource book for teachers, students, and researchers, but it is not designed for use directly as a textbook. It provides recommended methodology to evaluate aeroacoustics-related problems and suggests approaches to their solutions, without extensive tables, nomographs, and derivations. It is oriented
toward flight vehicles and emphasizes underlying physical concepts. Theoretical, experimental, and applied aspects are covered, including the main formulations, and comparisons of theory and experiment.

The preparation of the material for this book has been carried out under the general supervision of the AIAA Technical Committee on Aeracoustics. The Committee elected the editor (Harvey H. Hubbard), two associate editors (Christopher K.W. Tam and Robert H. Schlinker), and six additional editors (Charles E. Feiler, James C. Yu, Walter K. Eversman, Marvin E. Goldstein, Robert E. Kraft, and Yung H. Yu). Donald L. Lansing and John Laufer (until his untimely death) also served for short terms. They functioned as an editorial board to establish the overall policy for the organizing reviewing, and editing of the book. Each was selected because of his expert knowledge of at least one of the specialty areas covered in the book. They collectively comprise a team of experts who represent industry, government, and academia viewpoints.

The editorial board members chose by vote the lead authors for each chapter based on their stature and expertise in particular technical areas and on their proven ability to communicate. In all cases, contributing authors were selected and enlisted by the lead authors and on the basis of the same criteria. An outline of each chapter was first approved by the editorial board as a means of defining the overall scope of that chapter. Technical reviewers were chosen by vote of the editorial board based on their expertise of subject matter and the nature of their experience. Two to four persons were selected to provide technical reviews for each manuscript. These technical reviews were then provided to the appropriate authors as a basis for the preparation of their final manuscripts. Final editing was accomplished by Mary K. McCaskill and Thomas H. Brinkley of the NASA Langley Research Center Technical Editing Branch. Their work included checking for accuracy, grammar, consistency of style, compliance with editorial instructions, and assembly for printing.

Authors and reviewers contributed their time for this project without receiving compensation. Draft manuscript preparation, typing, and graphics were supported partially or wholly by the participant's employer. All these contributions were vital to the success of this project and are greatly appreciated. Supporting reference information cited in this book is limited to publications available at the time of the text preparation. No proprietary or classified information is included in order to protect the interests of authors' companies and governments. In order to enhance its utility, this book is divided into two volumes, each of which has a list of symbols, an index, and a separate glossary of terms. Reference lists for each chapter contain the key available supporting documents.

Volume 1 includes all the chapters that relate directly to the sources of flight vehicle noise: Propeller and Propfan Noise; Rotor Noise; Turbomachinery Noise; Jet Noise Classical Theory and Experiments; Noise From Turbulent Shear Flows; Lift Noise; Combustion and Core Noise; and Sonic Boom. Volume 2 includes those chapters that relate to flight vehicle noise control and/or operations: Human Response to Aircraft Noise; Atmospheric Propagation; Theoretical Models for Duct Acoustic Propagation and Radiation; Design and Performance of Duct Acoustic Treatment; Jet Noise Suppression; Interior Noise; Flyover-Noise Measurement and Prediction; and Quiet Aircraft Design and Operational Characteristics. This book was published initially in August 1991 as NASA Reference Publication 1258, Vols. 1 and 2, and with a companion United States Air Force Wright Research and Development Center designation as Technical Report 90-3052, Vols. 1 and 2. It was printed in soft cover and carried the appropriate NASA, U.S. Air Force, and U.S. Army logos on its covers.

In November 1993, the Acoustical Society of America agreed to reprint it in a hard-cover version but with modifications to the covers and title pages and with minor changes and corrections to the text. Elaine Moran of the Acoustical Society of America and Andrew Prince of the American Institute of Physics have coordinated the preparation of materials for this reprinting.
